PROFILE	I have practical experience in Data Science, including nearly a year as a Data Analyst at Aisera and a background in Software Engineering. I am proficient in Python, SQL, and Tableau. I have further developed my abilities through various side projects. I am currently working on freelance projects and attending hackathons. My educational background includes a Post Graduate Diploma from IIIT-Bengaluru and a BTech from VIT University, Vellore.		
TECHINCAL SKILLS			
Languages & Frameworks/ Tools: Python, PostgreSQL, Flask, AWS (S3), Steamlit, Gradio, Linux, MLFlow, Java.			
Deep Learning: NLP - Language Models, PyTorch.			
Machine Learning: Scikit-Learn, OpenCV, Pandas, Numpy, SciPy.			
EMPLOYMENT HISTORY			
Mar 2024 - Present	Data Freelancer (Remote)	Freelancing (Bhubaneswar, Odisha, India)	
	- As a Data Freelancer, I've focused on building and deploying Machine Learning models, including developing interactive web applications using Streamlit. My most recent hackathon submission's demo is here in this video. - Building Streamlit dashboard for a client to visualize the data. Understanding the existing code and suggesting the best way possible to present the data. - Providing valuable insights to clients for the AI Voice assistant project.		
Dec 2023 - Jan 2024	ML Engineer - Independent Contractor (Remote)	TradingGEN services (Innsbruck, Tyrol, Austria)	
	News Sentiment App - There's a need of an app which shortens the amount of time that is required to skim through the news and reach a conclusion about the sentiment of the market for retail investors. - Here, I worked on NewsAI app which summarizes news and predicts the sentiment of the same. I built a MVP which would take the news from the newsAPI. It would then summarize the fetched news. The summarized news would be used to predict a sentiment for the respective period and ticker. Tools / Framework: Gradio, HuggingFace Spaces, Python, Git. Links: App link; Documentation; Github repo link.		
Jun 2022 - Jan 2023	Data Analyst (Remote)	Aisera (Palo Alto, California, USA)	
	Date Shift Task - The AIOps module predicted when a particular system faults and provided early warnings to the user. In the demo site, the dates should should updated periodically, as it involves working on time series models which depended on dates. Writing SQL queries and running them periodically was tiresome job. So an automated python script was used to update the data used by the demo site. For a given time period, targeted environment (dev, test or prod), the script transformed the data to make it relevant. Masking and Anonymization - I handled client data for the Data Science team that contained PII (Personally Identifiable Information) like names, emails, and phone numbers, which could leak into models if not managed properly. The goal was to prevent privacy breaches during analysis. I hid the sensitive information by masking it before passing the data to downstream teams for analysis. This was done using the python package faker. First, the PPIs were detected using Regex and eventually replaced with fake data. This ensured privacy was maintained, and the data remained secure and usable for the team's modeling work. Documenting - The documentations for the AIOps module . I went through the existing code base for the project, build workflow diagrams for the same, created the data dictionary for the tables used for the transformation Tools/ Framework: Python, Postgres, Dbeaver, AWS - S3 bucket, Confluence, Airflow, Linux CLI.		
Jan 2019 - Jan 2021	Software Engineer (Hybrid)	Pointcross Life Sciences(Bengaluru, Karnataka, India)	
	- Curation and Transformation Facility: SQL Query Engine - Worked on the sub-module of the whole ETL process to query data from the ingested data. - Curation and Transformation Facility: Import and Export Audit Trail - Implemented event tracking feature for the Curation and Transformation Facility module. Tools/ Framework: Java, Hibernate, J2EE, Python.		

PERSONAL PROJECTS

Nov 2024 - Jan 2025	Long-term Financial News with LLMs • The project aimed to analyze the long-term trends using the Weekly news which was fetched from a RSS feed. • It used the LLM APIs along with RAG to answer user's queries. • This is open source contribution for the blog PythonInvest by Ivan Brigida. • <u>Tools/ Framework:</u> Polygon NewsAPI, Python, git, Ollama, langchain, FAISS. • Links: Link to the Blog ; Github repo link
Apr 2024 - Aug 2024	(Google + Bhashini) Techathon in collaboration with MachineHack platform • Hackathon was about suggesting a AI/ML solution to handle the customer audio complaints by converting them into text and categorizing them into relevant types and sub-types. • I designed an end-to-end solution. I used Bhashini's ULCA website to produce an indigenous audio complaints dataset, used a pre-trained model to convert to text, and another to classify the text into respective types. Stored the text in CSVs along with their predicted values. Finally, I created a dashboard to display customer complaints in a table. It also showed respective types in a pie chart and their variation over the last seven days in a time series chart. • I was one of the 10 finalists selected by Google and MachineHack to present the solution. I presented the solution to the judges at Google, Gurgaon, India over video conferencing. • Tools/Framework: Gradio, Git, Python, Prezi, Google Slides, Google Sheets • Links: Blog, Linkedin post
Apr 2024 - Aug 2024	NIFTY 50 Investment Analysis • The project aims to create a 10-stock portfolio from the NIFTY 50 to outperform the index using historical data from 2009-2023. • The portfolio's performance will be compared to an SBI NIFTY 50 ETF over a year (April 2023 - March 2024) to see if active stock selection beats passive investing. • Tools/Framework: Docker, Python, Git, Yahoo Finance API, Jupyter Notebooks, VS code • <u>Links:</u> Link to the project ; Stock Market Analysis Cert
Sept 2023 - Oct 2023	Shell's Cyber Threat Detection Hackathon in collaboration with MachineHack • The goal was to detect code snippets from the given raw text. This was to prevent cyber attacks that were widespread during the recent adoptions of LLMs since Nov 2022. A dataset filled with code snippets was provided. We had to suggest an approach to maximize the detection of code snippets for the given raw text. • I was the sole contributor. Developed a creative approach to detect code snippets in raw text, which included using the OpenAI model for iterative testing and generating a synthetic dataset for training custom OCR/text detection models. • The judges were very impressed with the approach of creating the dataset from the given raw texts. I got a consolation prize of \$100 for my creative approach. • Tools/Frameworks: OpenAI chatbot, Google Sheets, Google Colab • Links: LinkedIn Post

EDUCATION

Aug 2018 - Sept 2019	Post Graduate Diploma in Data Science (PGDDS), International Institute of Information Technology, Bangalore	Bengaluru, Karnataka, India
May 2011 - May 2015	B. Tech, Vellore Institute of Technology	Vellore, Tamil Nadu, India
